

## ABSTRACT

The present invention relates to technology  
5 concerning an analysis kit used to analyze specific  
components in a sample liquid. The present invention  
provides a test kit (1) including a penetration layer (4)  
and a plurality of coloration pads (3) in contact with  
the penetration layer (4), wherein a sample liquid (S)  
10 supplied to the penetration layer (4) is fed to each of  
the coloration pads (3) through the penetration layer (4).  
The penetration layer (4) allows liquid penetration  
mainly thicknesswise of the penetration layer (4) while  
restricting of liquid penetration in the planar direction  
15 of the penetration layer.
